Functional Description

Display RAM Address and Display Mode

The display RAM stores the data transmitted from an external device to TP6311 through the serial interface, and is assigned addresses as follows, in units of 8 bits:

Only the lower 4 bits of the addresses assigned to Seg17 through Seg20 are valid, and the higher 4 bits are ignored.

Key Matrix and Key-Input Data Storage RAM

The Key matrix is of 12×4 configuration, as shown below:

The data of each Key is stored as illustrated below, and is read by a read command, starting from the least significant bit.

KEY₁ KEY₄ KEY₁ KEY₄

Seg ₁ / KS ₁	Seg ₂ / KS ₂
Seg ₃ / KS ₃	Seg ₄ / KS ₄
Seg ₅ / KS ₅	Seg ₆ / KS ₆
Seg ₇ / KS ₇	Seg ₈ / KS ₈
Seg ₉ / KS ₉	Seg ₁₀ / KS ₁₀
Seg ₁₁ / KS ₁₁	Seg ₁₂ / KS ₁₂

b0 b3 b4 b7

Reading
Sequence

When the most significant bit data (Seg12 b7) has been read, the least significant bit of the next data (Seg1 b0) is read.

LED Port

Data is written to the LED port by a writing command, starting from the least significant bit of the port. When a bit of this port is 0, the corresponding LED lights; when the bit is 1, the LED goes off. The data of bits 6 through 8 is ignored.

On power application, all the LEDs remain dark.

SW Data

The SW data is read by a reading command, starting from the least significant bit. Bits 5 through 8 of the SW data are 0.

Commands

A command sets the display mode and status of the VFD driver.

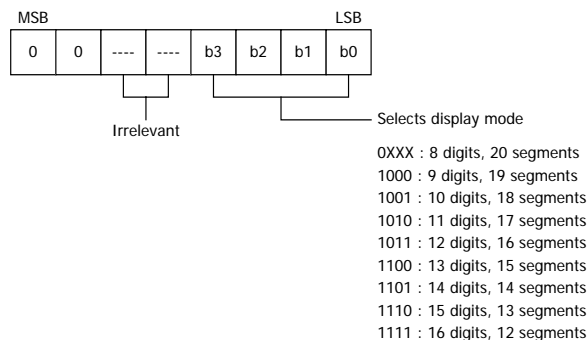

The first 1 byte input to TP6311 through the D_{IN} pin after the STB pin has fallen is regarded as a command.

If STB is high while a command/data is transmitted, serial communication is initialized, and the transmitting command/data is invalid; however, the command/data already transmitted remains valid.

(1) Display mode setting command

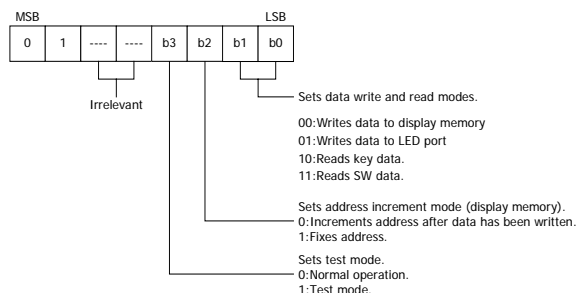

This command initializes the TP6311 and selects the number of segments and number of grids (1/8 to 1/11-duty, 12 segments to 20 segments).

On power application, the 16-digit, 12-segment mode is selected.

(2) Data setting commands

This command sets data write and read modes.

On power application, the normal operation mode and address increment mode set.

(3) Address setting command

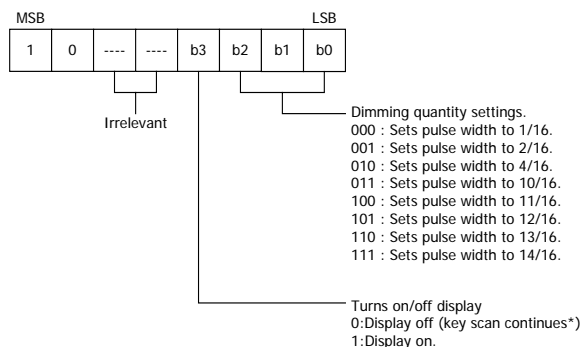

This command sets an address of the display memory.

If address 30H or higher is set, the data is ignored and unit a correct address is set.

On power application, the address is set to 00H.

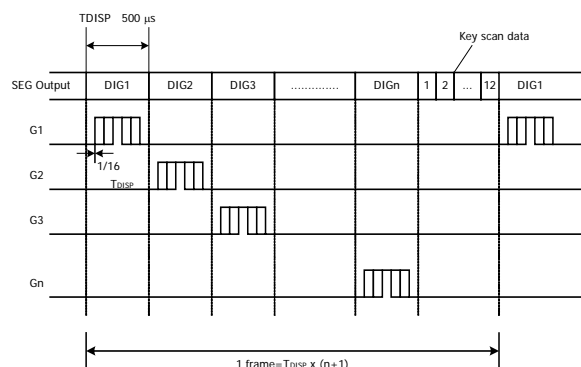

(4) Display control command

***: On power application, the key scanning is stopped.

On power application, the 14/16-pulse width is set and the display is turned off.

Key Scanning and Display Timing

One cycle of key scanning consists of two frames, and data of 12x4 matrices is stored in RAM.

Serial Communication Format

Reception (command/data write)

Transmission (data read)

Because the D_{OUT} pin is an N-ch open-drain output pin, be sure to connect an external pull-up resistor to this pin (1kΩ to 10 kΩ).

“*”: When data is read, a wait time (t_{WAIT}) of 1μs is necessary from the rising of the eighth clock that has set the command till the falling of the first clock that has read the data.

Maximum power consumption P_{MAX} = VFD driver dissipation + R_L dissipation + LED driver dissipation + dynamic power consumption.

When segment current = 3 mA, grid current = 15mA, and LED current = 20 mA,

VFD driver dissipation = number of segments x 6 + number of grids/(number of grids + 1) x 30(mW)

R_L dissipation = $(V_{DD}-V_{EE})^2/50 \times (\text{segment}+1)$ (mW)

LED driver dissipation = number of LEDs x 20(mW)

Dynamic power consumption = V_{DD} x 5(mW)

Example

When $V_{EE} = -30V$, $V_{DD} = 5V$, and in 16-segment and 12-digit modes:

VFD driver dissipation = $16 \times 6 + 12/13 \times 35 =$	128
R_L dissipation = $35^2/50 \times 17 =$	417
LED driver dissipation = $5 \times 20 =$	100
Dynamic power consumption = $5 \times 5 =$	25
Total	670 mW
